Service Level Report

1. Availability

Availability is measured per calendar month at the public API gateway. Planned maintenance windows announced at least 72 hours ahead are excluded.

Service	Target	October	November	December
API gateway	99.95%	99.97%	99.99%	99.96%
Web console	99.90%	99.93%	99.88%	99.95%
Batch exports	99.50%	99.71%	99.64%	99.80%

2. Incidents

The quarter had three incidents. None breached the monthly target.

Date	Service	Duration	Cause
2025-10-08	Web console	14 min	Expired certificate
2025-11-19	Web console	52 min	Database failover
2025-12-02	Batch exports	31 min	Queue backlog

3. Analysis

3.1 Review round 1

Root cause analysis. The certificate that expired on 8 October had been issued manually and was not covered by the automatic renewal job. All certificates were moved to automatic renewal on 15 October.

The failover of 19 November was triggered by a storage controller fault. Replication lag at the moment of failover was 4 seconds, which is within the recovery point objective of 30 seconds.

The export backlog of 2 December followed an unusually large customer job. A per-tenant concurrency limit now prevents one job from occupying all workers.

Preventive work planned for the next quarter includes a second gateway region, quarterly failover drills and a load test at three times the December peak.

3.2 Review round 2

Root cause analysis. The certificate that expired on 8 October had been issued manually and was not covered by the automatic renewal job. All certificates were moved to automatic renewal on 15 October.

The failover of 19 November was triggered by a storage controller fault. Replication lag at the moment of failover was 4 seconds, which is within the recovery point objective of 30 seconds.

The export backlog of 2 December followed an unusually large customer job. A per-tenant concurrency limit now prevents one job from occupying all workers.

Preventive work planned for the next quarter includes a second gateway region, quarterly failover drills and a load test at three times the December peak.

3.3 Review round 3

Root cause analysis. The certificate that expired on 8 October had been issued manually and was not covered by the automatic renewal job. All certificates were moved to automatic renewal on 15 October.

The failover of 19 November was triggered by a storage controller fault. Replication lag at the moment of failover was 4 seconds, which is within the recovery point objective of 30 seconds.

The export backlog of 2 December followed an unusually large customer job. A per-tenant concurrency limit now prevents one job from occupying all workers.

Preventive work planned for the next quarter includes a second gateway region, quarterly failover drills and a load test at three times the December peak.

3.4 Review round 4

Root cause analysis. The certificate that expired on 8 October had been issued manually and was not covered by the automatic renewal job. All certificates were moved to automatic renewal on 15 October.

The failover of 19 November was triggered by a storage controller fault. Replication lag at the moment of failover was 4 seconds, which is within the recovery point objective of 30 seconds.

The export backlog of 2 December followed an unusually large customer job. A per-tenant concurrency limit now prevents one job from occupying all workers.

Preventive work planned for the next quarter includes a second gateway region, quarterly failover drills and a load test at three times the December peak.

3.5 Review round 5

Root cause analysis. The certificate that expired on 8 October had been issued manually and was not covered by the automatic renewal job. All certificates were moved to automatic renewal on 15 October.

The failover of 19 November was triggered by a storage controller fault. Replication lag at the moment of failover was 4 seconds, which is within the recovery point objective of 30 seconds.

The export backlog of 2 December followed an unusually large customer job. A per-tenant concurrency limit now prevents one job from occupying all workers.

Preventive work planned for the next quarter includes a second gateway region, quarterly failover drills and a load test at three times the December peak.

3.6 Review round 6

Root cause analysis. The certificate that expired on 8 October had been issued manually and was not covered by the automatic renewal job. All certificates were moved to automatic renewal on 15 October.

The failover of 19 November was triggered by a storage controller fault. Replication lag at the moment of failover was 4 seconds, which is within the recovery point objective of 30 seconds.

The export backlog of 2 December followed an unusually large customer job. A per-tenant concurrency limit now prevents one job from occupying all workers.

Preventive work planned for the next quarter includes a second gateway region, quarterly failover drills and a load test at three times the December peak.

3.7 Review round 7

Root cause analysis. The certificate that expired on 8 October had been issued manually and was not covered by the automatic renewal job. All certificates were moved to automatic renewal on 15 October.

The failover of 19 November was triggered by a storage controller fault. Replication lag at the moment of failover was 4 seconds, which is within the recovery point objective of 30 seconds.

The export backlog of 2 December followed an unusually large customer job. A per-tenant concurrency limit now prevents one job from occupying all workers.

Preventive work planned for the next quarter includes a second gateway region, quarterly failover drills and a load test at three times the December peak.

3.8 Review round 8

Root cause analysis. The certificate that expired on 8 October had been issued manually and was not covered by the automatic renewal job. All certificates were moved to automatic renewal on 15 October.

The failover of 19 November was triggered by a storage controller fault. Replication lag at the moment of failover was 4 seconds, which is within the recovery point objective of 30 seconds.

The export backlog of 2 December followed an unusually large customer job. A per-tenant concurrency limit now prevents one job from occupying all workers.

Preventive work planned for the next quarter includes a second gateway region, quarterly failover drills and a load test at three times the December peak.

3.9 Review round 9

Root cause analysis. The certificate that expired on 8 October had been issued manually and was not covered by the automatic renewal job. All certificates were moved to automatic renewal on 15 October.

The failover of 19 November was triggered by a storage controller fault. Replication lag at the moment of failover was 4 seconds, which is within the recovery point objective of 30 seconds.

The export backlog of 2 December followed an unusually large customer job. A per-tenant concurrency limit now prevents one job from occupying all workers.

Preventive work planned for the next quarter includes a second gateway region, quarterly failover drills and a load test at three times the December peak.
